On the complete integrability of the N-dimensional differential systems

JAUME LLIBRE

Universitat Autònoma de Barcelona www.gsd.uab.cat

This work has been made in collaboration with Rafael Ramírez and Valentín Ramírez

Castro Urdiales, June 21, 2019

The objectives

2 Preliminary results on completely integrable vector fields

- 3 Nambu vector field and Nambu bracket
- Main results: THEOREM 1, its COROLLARY and THEOREM 2
- 5 Proof of THEOREM 1
- 6 Applications of the COROLLARY

It is well known the classical result that if a 2-dimensional differential system

$$\frac{dx_1}{dt} = \dot{x}_1 = X_1(x_1, x_2) = X_1, \qquad \frac{dx_2}{dt} = \dot{x}_2 = X_2(x_1, x_2) = X_2,$$

has an integrating factor $J = J(x_1, x_2)$, then doing the change in the independent variable $t \to \tau$ given by

$$d au = Jdt$$
,

this differential can be written as

$$\frac{dx_1}{d\tau} = x_1' = -\frac{1}{J}\frac{\partial H}{\partial x_2} = X_1, \qquad \frac{dx_2}{d\tau} = x_2' = \frac{1}{J}\frac{\partial H}{\partial x_1} = X_2,$$

for a convenient function $H = H(x_1, x_2)$, being H a first integral of the system.

크

The two main objectives of this talk are:

The two main objectives of this talk are:

The extension of the previous classical result for
 dimensional differential systems to complete integrable
 N-dimensional differential systems in different directions, using as the main tool the Nambu bracket.

The two main objectives of this talk are:

The extension of the previous classical result for
 dimensional differential systems to complete integrable
 N-dimensional differential systems in different directions, using as the main tool the Nambu bracket.

2) These new results on the complete integrable systems in dimension N using the Nambu bracket allows to do some interesting applications.

・ロト ・ 日 ・ ・ ヨ ・ ・ ヨ ・

In the rest of this talk we will work with the *N*-dimensional differential system

$$\dot{x}_j = X_j(x_1,\ldots,x_N), \quad \text{for} \quad j = 1,\ldots,N,$$

or with its associated vector field

$$\mathcal{X} = X_1 \frac{\partial}{\partial x_1} + X_2 \frac{\partial}{\partial x_2} + \ldots + X_N \frac{\partial}{\partial x_N}.$$

(日)

크

Let $V \subset U$ be an open subset. Here a first integral of a vector field \mathcal{X} defined in U is a \mathcal{C}^1 non–locally constant function $H: V \to \mathbb{R}$ such that it is constant on the solutions $(x_1(t), \ldots, x_N(t))$ of the vector field \mathcal{X} contained in V,

Let $V \subset U$ be an open subset. Here a first integral of a vector field \mathcal{X} defined in U is a \mathcal{C}^1 non–locally constant function $H: V \to \mathbb{R}$ such that it is constant on the solutions $(x_1(t), \ldots, x_N(t))$ of the vector field \mathcal{X} contained in V,

i.e.

$$\dot{H} = \frac{\partial H}{\partial x_1} X_1 + \frac{\partial H}{\partial x_2} X_2 + \ldots + \frac{\partial H}{\partial x_N} X_N \equiv 0$$
 in V.

For an *N*-dimensional differential systems the existence of N-1 independent first integrals H_1, \ldots, H_{N-1} means that the system is completely integrable,

For an *N*-dimensional differential systems the existence of N-1 independent first integrals H_1, \ldots, H_{N-1} means that the system is completely integrable,

i.e. the orbits of the vector field \mathcal{X} are contained in the curves

$$\left\{H_1=h_1\right\}\cap\left\{H_2=h_2\right\}\cap\ldots\cap\left\{H_{N-1}=h_{N-1}\right\}$$

where $h_1, h_2 \dots, h_{N-1}$ vary in \mathbb{R} .

If $H_r : V_r \longrightarrow \mathbb{R}$ for r = 1, ..., K are K first integrals of the vector field \mathcal{X} , we say that they are independent in $\tilde{V} := V_1 \cap V_2 \cap ... \cap V_K$, if their gradients are independent in all the points of \tilde{V} except perhaps in a zero Lebesgue measure set.

A B > A B >

Let $J = J(x_1, ..., x_N)$ be a non–negative function non–identically zero on an open subset *V* of *U*, being *U* the domain of definition of the vector field \mathcal{X} .

Let $J = J(x_1, ..., x_N)$ be a non–negative function non–identically zero on an open subset V of U, being U the domain of definition of the vector field \mathcal{X} .

Then J is a Jacobi multiplier of the vector field \mathcal{X} if

$$\int_{\Omega} J(x_1,\ldots,x_N) dx_1 \ldots dx_N = \int_{\varphi_t(\Omega)} J(x_1,\ldots,x_N) dx_1 \ldots dx_N,$$

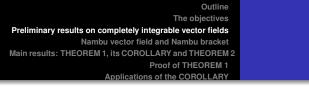

being Ω any open subset of V, φ_t is the flow defined by \mathcal{X} , and $\varphi_t(\Omega)$ is the image of the domain Ω under the flow φ_t .

(日)

Whittaker's result helps to detect a Jacobi multiplier:

THEOREM 1. For j = 1, ..., N - 1 let H_j be N - 1 independent C^2 functions. An *N*-dimensional differential system $\dot{x}_j = X_j(x_1, ..., x_N) = X_j$ for j = 1, ..., N is completely integrable with the first integrals H_j for j = 1, ..., N - 1 if and only if it can be written as

$$\dot{x}_j = \frac{1}{J} \Big\{ H_1, H_2, \dots, H_{N-1}, x_j \Big\} = X_j, \text{ for } j = 1, \dots, N,$$

・ロト ・ 同 ト ・ 国 ト ・ 国 ト …

where $J = J(x_1, x_2, ..., x_N)$ is a Jacobi multiplier and $\{H_1, H_2, ..., H_{N-1}, *\}$ is the Nambu vector field.

THEOREM 1 generalizes the classical result that if a 2-dimensional differential system

 $\dot{x}_1 = X_1(x_1, x_2), \qquad \dot{x}_2 = X_2(x_1, x_2),$

has an integrating factor J, then it can be written as

$$\dot{x}_1 = -\frac{1}{J}\frac{\partial H_1}{\partial x_2} = X_1, \qquad \dot{x}_2 = \frac{1}{J}\frac{\partial H_1}{\partial x_1} = X_2,$$

to N-dimensional differential systems, because

$$-rac{\partial H_1}{\partial x_2} = \{H_1, x_1\}, \text{ and } rac{\partial H_1}{\partial x_1} = \{H_1, x_2\},$$

where $\{H_1, x_1\}$ and $\{H_1, x_2\}$, are Nambu brackets.

COROLLARY. Assume that an *N*-dimensional vector field \mathcal{X} has N - 2 independent first integrals $H_1, H_2, \ldots, H_{N-2}$ and a Jacobi multiplier *J*,

э

COROLLARY. Assume that an *N*-dimensional vector field \mathcal{X} has N - 2 independent first integrals $H_1, H_2, \ldots, H_{N-2}$ and a Jacobi multiplier *J*, then another independent first integral H_{N-1} can be obtained as a solution of the first order partial differential system

 $\{H_1, H_2, \dots, H_{N-2}, H_{N-1}, x_j\} = JX_j, \quad \text{for} \quad j = 1, \dots, N,$

where $\{H_1, H_2, \dots, H_{N-2}, H_{N-1}, *\}$ is the Nambu vector field.

THEOREM 2. \mathcal{X} is completely integrable if and only if \mathcal{X} has N - r first integrals H_1, \ldots, H_{N-r} , and r - 1 Jacobi multipliers $J_{N-r+1}, \ldots, J_{N-1}$ such that $H_n = J_n/J_{N-1}$ for $n = N - r + 1, \ldots, N - 2$ are non locally constant, and the functions H_1, \ldots, H_{N-2} are independent.

For r = 1 the THEOREM 2 is the definition that \mathcal{X} completely integrable.

THEOREM 2. \mathcal{X} is completely integrable if and only if \mathcal{X} has N - r first integrals H_1, \ldots, H_{N-r} , and r - 1 Jacobi multipliers $J_{N-r+1}, \ldots, J_{N-1}$ such that $H_n = J_n/J_{N-1}$ for $n = N - r + 1, \ldots, N - 2$ are non locally constant, and the functions H_1, \ldots, H_{N-2} are independent.

For r = 1 the THEOREM 2 is the definition that \mathcal{X} completely integrable.

For r = 2 the THEOREM 2 is the Jacobi Theorem.

We recall the statement of THEOREM 1.

Ξ.

We recall the statement of THEOREM 1.

THEOREM 1. For j = 1, ..., N - 1 let H_j be N - 1 independent C^2 functions. An *N*-dimensional differential system $\dot{x}_j = X_j(x_1, ..., x_N) = X_j$ for j = 1, ..., N is completely integrable with the first integrals H_j for j = 1, ..., N - 1 if and only if it can be written as

$$\dot{x}_j = \frac{1}{J} \Big\{ H_1, H_2, \dots, H_{N-1}, x_j \Big\} = X_j, \text{ for } j = 1, \dots, N,$$

・ロト ・四ト ・ヨト ・ヨト

where $J = J(x_1, x_2, ..., x_N)$ is a Jacobi multiplier and $\{H_1, H_2, ..., H_{N-1}, *\}$ is the Nambu vector field.

We recall the definition of the Nambu vector field:

$$\left\{H_{1}, H_{2}, \dots, H_{N-1}, *\right\} = \begin{vmatrix} \frac{\partial H_{1}}{\partial x_{1}} & \frac{\partial H_{1}}{\partial x_{2}} & \cdots & \frac{\partial H_{1}}{\partial x_{N}} \\ \frac{\partial H_{2}}{\partial x_{1}} & \frac{\partial H_{2}}{\partial x_{2}} & \cdots & \frac{\partial H_{2}}{\partial x_{N}} \\ \vdots & \vdots & \ddots & \vdots \\ \frac{\partial H_{N-1}}{\partial x_{1}} & \frac{\partial H_{N-1}}{\partial x_{2}} & \cdots & \frac{\partial H_{N-1}}{\partial x_{N}} \\ \frac{\partial}{\partial x_{1}} & \frac{\partial}{\partial x_{2}} & \cdots & \frac{\partial}{\partial x_{N}} \end{vmatrix}$$

æ

Since the *N*-dimensional vector field \mathcal{X} is completely integrable, there exist N - 1 independent first integrals H_1, \ldots, H_{N-1} such that

$$\mathcal{X}(H_j) = X_1 \frac{\partial H_j}{\partial x_1} + \ldots + X_{N-1} \frac{\partial H_j}{\partial x_{N-1}} + X_N \frac{\partial H_j}{\partial x_N} = 0,$$

for $j = 1, 2, \ldots, N-1$, or equivalently

◆□▶ ◆□▶ ◆三▶ ◆三▶ ● ○○○

Since the *N*-dimensional vector field \mathcal{X} is completely integrable, there exist N - 1 independent first integrals H_1, \ldots, H_{N-1} such that

$$\mathcal{X}(H_j) = X_1 \frac{\partial H_j}{\partial x_1} + \ldots + X_{N-1} \frac{\partial H_j}{\partial x_{N-1}} + X_N \frac{\partial H_j}{\partial x_N} = 0.$$

for $j = 1, 2, \ldots, N-1$, or equivalently
$$X_1 \frac{\partial H_j}{\partial x_1} + \ldots + X_{N-1} \frac{\partial H_j}{\partial x_{N-1}} = -X_N \frac{\partial H_j}{\partial x_N},$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Since the *N*-dimensional vector field \mathcal{X} is completely integrable, there exist N - 1 independent first integrals H_1, \ldots, H_{N-1} such that

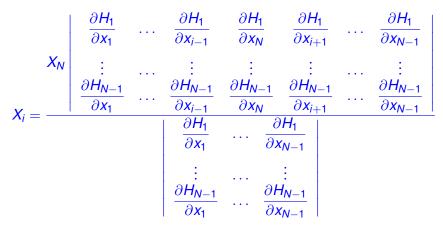

$$\mathcal{X}(H_j) = X_1 \frac{\partial H_j}{\partial x_1} + \dots + X_{N-1} \frac{\partial H_j}{\partial x_{N-1}} + X_N \frac{\partial H_j}{\partial x_N} = 0,$$

for $j = 1, 2, \dots, N-1$, or equivalently
$$X_1 \frac{\partial H_j}{\partial x_1} + \dots + X_{N-1} \frac{\partial H_j}{\partial x_{N-1}} = -X_N \frac{\partial H_j}{\partial x_N},$$

for $j = 1, 2, \dots, N-1$. We solve this linear system in the

for j = 1, 2, ..., N - 1. We solve this linear system in the variables $X_1, ..., X_{N-1}$, and we obtain

(日) (圖) (E) (E) (E)

(4日)

for i = 1, ..., N - 1.

Consequently

$$\mathcal{X} = X_1 \frac{\partial}{\partial x_1} + X_2 \frac{\partial}{\partial x_2} + \ldots + X_N \frac{\partial}{\partial x_N} = \lambda \Big\{ H_1, H_2, \ldots, H_{N-1}, * \Big\}.$$

where

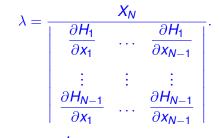

$$\lambda = \frac{X_N}{\begin{vmatrix} \frac{\partial H_1}{\partial x_1} & \cdots & \frac{\partial H_1}{\partial x_{N-1}} \\ \vdots & \vdots & \vdots \\ \frac{\partial H_{N-1}}{\partial x_1} & \cdots & \frac{\partial H_{N-1}}{\partial x_{N-1}} \end{vmatrix}}.$$

æ

Consequently

$$\mathcal{X} = X_1 \frac{\partial}{\partial x_1} + X_2 \frac{\partial}{\partial x_2} + \ldots + X_N \frac{\partial}{\partial x_N} = \lambda \Big\{ H_1, H_2, \ldots, H_{N-1}, * \Big\}.$$

where

<回><モン<

æ

Now we prove that $J = \frac{1}{\lambda}$ is a Jacobi multiplier.

Indeed from the properties of the Nambu vector field (see for instance Proposition 1.2.1 of

J. Llibre and R. Ramírez, Inverse problems in ordinary differential equations and applications, Progress in Math. **313**, Birkhäuser, 2016.

we get that the divergence of the Nambu vector field is zero, i.e.

 $\operatorname{div}(\{H_1, H_2, \ldots, H_{N-1}, *\}) = 0.$

・ロト ・四ト ・ヨト

On the other hand, $\frac{1}{\lambda} \mathcal{X} = \{H_1, H_2, \dots, H_{N-1}, *\}$. Therefore in view of the previous equality we get that

$$0 = \operatorname{div}\{H_1, \ldots, H_{N-1}, *\} = \operatorname{div}(\frac{\mathcal{X}}{\lambda}) = \frac{\partial(\frac{X_1}{\lambda})}{\partial x_1} + \frac{\partial(\frac{X_2}{\lambda})}{\partial x_2} + \ldots + \frac{\partial(\frac{X_N}{\lambda})}{\partial x_N}.$$

< □→ < □→ < □→

So $\frac{1}{\lambda}$ is a Jacobi multiplier by Whittaker's Theorem.

The reciprocity follows trivially.

for j = 1, 2, ..., N - 1.

In short THEOREM 1 is proved.

Asymmetric May–Leonard model Symmetric May–Leonard model A Lotka–Volterra system

We recall the statement of the COROLLARY:

COROLLARY. Assume that an *N*-dimensional vector field \mathcal{X} has N - 2 independent first integrals $H_1, H_2, \ldots, H_{N-2}$ and a Jacobi multiplier *J*, then another independent first integral H_{N-1} can be obtained as a solution of the first order partial differential system

 $\{H_1, H_2, \dots, H_{N-2}, H_{N-1}, x_j\} = JX_j,$ for $j = 1, \dots, N$, where $\{H_1, H_2, \dots, H_{N-2}, H_{N-1}, *\}$ is the Nambu vector field.

Asymmetric May–Leonard model Symmetric May–Leonard model A Lotka–Volterra system

We shall illustrated the applications of the COROLLARY in the determination of the second first integral of the Jacobi Theorem in the following three particular cases of 3–dimensional Lotka–Volterra differential systems. We study the existence of a second first integral H_2

The class of asymmetric May–Leonard models

 $\dot{x} = x (1 - x - (2 - b_2)y - b_1z) = X_1(x, y, z),$ $\dot{y} = y (1 - y - (2 - b_3)z - b_2x) = X_2(x, y, z),$ $\dot{z} = z (1 - z - (2 - b_1)x - b_3y) = X_3(x, y, z),$

with $b_1 + b_2 + b_3 = 3$ is completely integrable.

Asymmetric May–Leonard model Symmetric May–Leonard model A Lotka–Volterra system

The class of asymmetric May–Leonard models

 $\dot{x} = x (1 - x - (2 - b_2)y - b_1z) = X_1(x, y, z),$ $\dot{y} = y (1 - y - (2 - b_3)z - b_2x) = X_2(x, y, z),$ $\dot{z} = z (1 - z - (2 - b_1)x - b_3y) = X_3(x, y, z),$

with $b_1 + b_2 + b_3 = 3$ is completely integrable.

More precisely, this system has the first integral H_1 and the Jacobi multiplier J:

$$H_1 = \left| \frac{z}{y} \right|^{b_2 - 1} \left| \frac{x}{y} \right|^{b_3 - 1}, \qquad J = \frac{1}{|xyz(x + y + z - 1)|},$$

and a second independent first integral H_2 , which is determined by using the COROLLARY,

Asymmetric May–Leonard model Symmetric May–Leonard model A Lotka–Volterra system

i.e. H_2 is determined solving for H_2 the partial differential equation of the COROLLARY for N = 3:

$\frac{\partial H_1}{\partial y}\frac{\partial H_2}{\partial z} -$	$-\frac{\partial H_1}{\partial z}\frac{\partial H_2}{\partial y} =$	<i>JX</i> ₁ ,
$\frac{\partial H_1}{\partial z}\frac{\partial H_2}{\partial x} -$	$-\frac{\partial H_1}{\partial x}\frac{\partial H_2}{\partial z} =$	<i>JX</i> ₂ ,
$\frac{\partial H_1}{\partial x}\frac{\partial H_2}{\partial y} -$	$-\frac{\partial H_1}{\partial y}\frac{\partial H_2}{\partial x} =$	<i>JX</i> 3,

we get that H_2 is equal to

$$\frac{1}{H_1}\log\Big(\left(\frac{z}{y|x+y+z-1|^{b_3-1}}\right)^{1-b_2}\left(\frac{x}{y|x+y+z-1|^{1-b_2}}\right)^{b_3-1}\Big).$$

Asymmetric May–Leonard model Symmetric May–Leonard model A Lotka–Volterra system

Consider the symmetric May–Leonard model

$$\begin{aligned} \dot{x} &= x\left(1-x-ay-bz\right),\\ \dot{y} &= y\left(1-y-bx-az\right),\\ \dot{z} &= z\left(1-z-ax-by\right), \end{aligned}$$

If a + b = 2 this system has the first integral H_1 and the Jacobi multiplier J, where

$$H_1 = \frac{xyz}{(x+y+z)^3}$$
, and $J = \frac{1}{|xyz(x+y+z-1)|}$

Asymmetric May–Leonard model Symmetric May–Leonard model A Lotka–Volterra system

Now using the COROLLARY a second independent first integral is

$$H_2 = \frac{1}{H_1} \left((b-1) \log |x+y+z-1| + \Lambda \left(\frac{y}{x}, \frac{z}{x} \right) \right),$$

where $\Lambda = \Lambda\left(\frac{y}{x}, \frac{z}{x}\right)$ is a solution of the partial differential equation

$$-(2\eta - \xi - 1)\xi rac{\partial ilde{\Lambda}}{\partial \xi} + (2\xi - \eta - 1)\eta rac{\partial ilde{\Lambda}}{\partial \eta} = -(1 + \xi + \eta),$$

where $\tilde{\Lambda} = \Lambda(\xi, \eta)$, $\xi = y/x$, and $\eta = z/x$.

Asymmetric May–Leonard model Symmetric May–Leonard model A Lotka–Volterra system

The Lotka–Volterra differential system

$$\dot{x} = x(2 + ax),$$

 $\dot{y} = y(-1 + dx + hy + kz),$
 $\dot{z} = z(1 + gx + hy + kz),$

has the first integral $H_1 = z(2 + ax)^{\frac{d+a-g}{a}}/(xy)$ and the Jacobi multiplier $J = x^{-\frac{5}{2}}y^{-3}(2 + ax)^{-\frac{2(g-2d)-a}{2a}}$.

Asymmetric May–Leonard model Symmetric May–Leonard model A Lotka–Volterra system

Then it has the second first integral

$$H_2 = \frac{(2+ax)^{\frac{a+2d}{2a}}}{\sqrt{x}} \left(\frac{1}{y} + T(\frac{z}{y}, x)\right).$$

where the function $T = T(\frac{z}{y}, x)$ is a solution of the partial differential equation

$$(2 + (g - d)x)\eta \frac{\partial T}{\partial \eta} + x(2 + ax)\frac{\partial T}{\partial x} + (x d - 1)T(\eta, x) = h + k\eta,$$

with $\eta = \frac{z}{y}$.

The end

Asymmetric May–Leonard model Symmetric May–Leonard model A Lotka–Volterra system
