$$z' = V(z), \qquad z \in \Omega.$$

We call $\phi_V(t, z)$ be the local flow defined by V in Ω .

A critical point *O* is a center if it has a punctured neighbourhood covered with non-trivial cycles.

Figure : A central region of x' = y, $y' = -\sin x$.

We call central region the largest connected region surrounding a center, covered with non-trivial cycles.

(ロ)、(型)、(E)、(E)、 E) の(の)

We call central region the largest connected region surrounding a center, covered with non-trivial cycles. We call period annulus every connected region covered with non-trivial cycles.

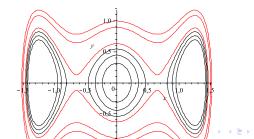

We call central region the largest connected region surrounding a center, covered with non-trivial cycles. We call period annulus every connected region covered with non-trivial cycles.

A period annulus may be contained in a central region, but there exist period annuli not contained in any central region (in red in next figure).

We call central region the largest connected region surrounding a center, covered with non-trivial cycles. We call period annulus every connected region covered with non-trivial cycles.

A period annulus may be contained in a central region, but there exist period annuli not contained in any central region (in red in next figure).

Figure : 3 central regions, 4 period annuli.

Given a period annulus A, we define a period function $T : A \to IR$ by assigning to every point $z \in A$ the minimum positive period of the cycle γ_z passing through z.

Given a period annulus A, we define a period function $T : A \to \mathbb{R}$ by assigning to every point $z \in A$ the minimum positive period of the cycle γ_z passing through z.

T is a first integral of the system, i. e. it is constant on every cycle.

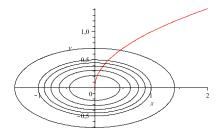

Given a period annulus A, we define a period function $T : A \to \mathbb{R}$ by assigning to every point $z \in A$ the minimum positive period of the cycle γ_z passing through z.

T is a first integral of the system, i. e. it is constant on every cycle.

If $V(z) \in C^{\infty}(\Omega, \mathbb{R}^2)$, then $T \in C^{\infty}(\Omega, \mathbb{R})$.

Period function

Choose a transversal curve $\delta(s)$ of class C^{∞} , parametrize A's cycles using s, write T as a function of s: $T = T(s) = T(\delta(s))$. Then $T \in C^{\infty}$.

Question: why study T?

Question: why study T?

1. Stability: A cycle γ is stable if and only if T is constant in a neighbourhood of γ .

Choosen an "initial cycle" γ_{z^*} , where s = 0, one can parametrize the other cycles by means of s. In this way, sbecomes a first integral of V.

T is a function of s,
$$T = T(s) = T(\phi_W(s, \gamma_{z^*})).$$

If
$$z = \phi_W(s, z^*)$$
, we write
 $\partial_W T(z) = \frac{d}{ds} \left(T(\phi_W(s, z^*)) \right) = T'(s).$

<□ > < @ > < E > < E > E のQ @

If
$$z = \phi_W(s, z^*)$$
, we write
 $\partial_W T(z) = \frac{d}{ds} \left(T(\phi_W(s, z^*)) \right) = T'(s).$

T(z) is a first integral of V, as well all other derivatives $\partial_{W}^{(n)}T(z)$ of T w. resp. to s.

If
$$z = \phi_W(s, z^*)$$
, we write
 $\partial_W T(z) = \frac{d}{ds} \left(T(\phi_W(s, z^*)) \right) = T'(s).$

T(z) is a first integral of V, as well all other derivatives $\partial_W^{(n)} T(z)$ of T w. resp. to s.

Freire, Gasull, Guillamon (JDE 2004) proved:

Theorem

If V has a period annulus A, W is transversal to V, and $[V, W] = \mu V$, then

$$\partial_W T(z) = \int_0^{T(z)} \mu(\phi_V(t,z)) dt$$

If
$$z = \phi_W(s, z^*)$$
, we write
 $\partial_W T(z) = \frac{d}{ds} \left(T(\phi_W(s, z^*)) \right) = T'(s).$

T(z) is a first integral of V, as well all other derivatives $\partial_W^{(n)} T(z)$ of T w. resp. to s.

Freire, Gasull, Guillamon (JDE 2004) proved:

Theorem

If V has a period annulus A, W is transversal to V, and $[V, W] = \mu V$, then

$$\partial_W T(z) = \int_0^{T(z)} \mu(\phi_V(t,z)) dt.$$

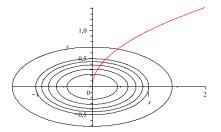

$$\mu > 0 \implies T' > 0.$$

Every section comes from a normalizer

For every transversal curve $\delta(s)$ there exists a normalizer W of V and a point $z \in A$ such that

$$\delta(\boldsymbol{s}) = \phi_W(\boldsymbol{s}, \gamma_{\boldsymbol{z}^*})$$

Figure : Every $\delta(s)$ is an orbit of a normalizer .

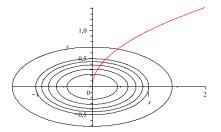

Every section comes from a normalizer

Figure : Every $\delta(s)$ is an orbit of a normalizer .

Methods used to find centers and period annuli often produce first integrals (important exceptions: reversible systems).

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

Methods used to find centers and period annuli often produce first integrals (important exceptions: reversible systems).

If V has a first integral H, then, for every smooth $\alpha: \mathbb{R} \to \mathbb{R}$, the vector field associated to

$$x' = \alpha(H) \frac{H_x}{H_x^2 + H_y^2}, \qquad y' = \alpha(H) \frac{H_y}{H_x^2 + H_y^2},$$

is a normalizer. In fact, $\dot{H} = \alpha(H)$.

Methods used to find centers and period annuli often produce first integrals (important exceptions: reversible systems).

If V has a first integral H, then, for every smooth $\alpha: \mathbb{R} \to \mathbb{R}$, the vector field associated to

$$x' = \alpha(H) \frac{H_x}{H_x^2 + H_y^2}, \qquad y' = \alpha(H) \frac{H_y}{H_x^2 + H_y^2},$$

is a normalizer. In fact, $\dot{H} = \alpha(H)$.

If V is the Hamiltonian system

$$x' = H_y, \qquad y' = -H_x,$$

and $\alpha(r) = 1$, then

$$\mu_{H} = \frac{(H_{yy} - H_{xx})H_{x}^{2} - 4H_{xy}H_{x}H_{y} + (H_{xx} - H_{yy})H_{y}^{2}}{|\nabla H|^{4}},$$

Freire, Gasull, Guillamon (JDE 2004) found a simpler normalizer for Hamiltonian systems with separable variables,

$$x' = F'(y), \qquad y' = -G'(x).$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

Freire, Gasull, Guillamon (JDE 2004) found a simpler normalizer for Hamiltonian systems with separable variables,

$$x' = F'(y), \qquad y' = -G'(x).$$

Their normalizer is itself with separable variables,

$$x' = rac{G(x)}{G'(x)}, \qquad y' = rac{F(y)}{F'(y)}.$$

Freire, Gasull, Guillamon (JDE 2004) found a simpler normalizer for Hamiltonian systems with separable variables,

$$x' = F'(y), \qquad y' = -G'(x).$$

Their normalizer is itself with separable variables,

$$x' = \frac{G(x)}{G'(x)}, \qquad y' = \frac{F(y)}{F'(y)}.$$

this produces an N-cofactor with separable variables,

$$\mu_{FGG} = \left(\frac{G(x)}{G'(x)}\right)' + \left(\frac{F(y)}{F'(y)}\right)' - 1.$$

Jacobian maps and annuli

<□▶ < @▶ < @▶ < @▶ < @▶ < @ > @ < の < @</p>

Jacobian maps and annuli

Let $\Psi = (P, Q) \in C^{\infty}(\Omega, \mathbb{R}^2)$, with jacobian matrix J_{Ψ} . If $\delta = \det J_{\Psi} \neq 0$, we say that it is a jacobian map.

Jacobian maps and annuli

Let $\Psi = (P, Q) \in C^{\infty}(\Omega, \mathbb{R}^2)$, with jacobian matrix J_{Ψ} . If $\delta = \det J_{\Psi} \neq 0$, we say that it is a jacobian map.

If $\Psi = (P, Q)$ is a jacobian map, then the Hamiltonian system with $H = \frac{P^2 + Q^2}{2}$ as hamiltonian,

$$x' = PP_y + QQ_y, \qquad y' = -PP_x - QQ_x,$$

has a center at every extremum of H. It can also have non-central period annuli.

Jacobian maps and annuli

Let $\Psi = (P, Q) \in C^{\infty}(\Omega, \mathbb{R}^2)$, with jacobian matrix J_{Ψ} . If $\delta = \det J_{\Psi} \neq 0$, we say that it is a jacobian map.

If $\Psi = (P, Q)$ is a jacobian map, then the Hamiltonian system with $H = \frac{P^2 + Q^2}{2}$ as hamiltonian,

$$x' = PP_y + QQ_y, \qquad y' = -PP_x - QQ_x,$$

has a center at every extremum of H. It can also have non-central period annuli.

A normalizer is the system W_{δ}

$$x' = rac{PQ_y - QP_y}{\delta}, \qquad y' = rac{-PQ_x + QP_x}{\delta}$$

with C-factor and N-cofactor given by

$$m_s = rac{1}{\delta}, \qquad \mu_s = -rac{\partial_{W_\delta}\delta}{\delta}.$$

If F(0) = 0, G(0) = 0, yF'(y) > 0 for $x \neq 0$, xG'(x) > 0 for $y \neq 0$, F''(0) > 0, G''(0) > 0, the system

$$x' = F'(y), \qquad y' = -G'(x).$$

comes from the jacobian map $\Psi(x, y) = (P(x), Q(y))$ = $(s(x)\sqrt{2G(x)}, s(y)\sqrt{2F(y)})$; s(t) sign function. It has a center at the origin O

If F(0) = 0, G(0) = 0, yF'(y) > 0 for $x \neq 0$, xG'(x) > 0 for $y \neq 0$, F''(0) > 0, G''(0) > 0, the system

$$x' = F'(y), \qquad y' = -G'(x).$$

comes from the jacobian map $\Psi(x, y) = (P(x), Q(y))$ = $(s(x)\sqrt{2G(x)}, s(y)\sqrt{2F(y)})$; s(t) sign function. It has a center at the origin O

Its jacobian determinant is

$$\delta(x, y) = P'(x)Q'(y) = \frac{1}{2} \frac{s(x)G'(x)}{\sqrt{G(x)}} \frac{s(y)F'(y)}{\sqrt{F(y)}}$$

From the determinant we get the C-factor. It has separable variables.

$$m_{s}(x,y) = \frac{1}{P'(x)Q'(y)} = 2\frac{s(x)\sqrt{G(x)}}{G'(x)}\frac{s(y)\sqrt{F(y)}}{F'(y)}.$$

From the determinant we get the C-factor. It has separable variables.

$$m_{s}(x,y) = \frac{1}{P'(x)Q'(y)} = 2\frac{s(x)\sqrt{G(x)}}{G'(x)}\frac{s(y)\sqrt{F(y)}}{F'(y)}.$$

From the C-factor we get the N-cofactor

$$\mu_{s} = -\partial_{W_{\delta}} \left(\ln P'(x)Q'(y) \right) = -\partial_{W_{\delta}} \ln P'(x) - \partial_{W_{\delta}} \ln Q'(y)$$
$$= -\partial_{W_{\delta}} \left(\ln \frac{2s(x)G'(x)}{\sqrt{2G(x)}} \right) - \partial_{W_{\delta}} \left(\ln \frac{2s(y)F'(y)}{\sqrt{2F(y)}} \right)$$

Theorem The period function of the system

$$x' = F'(y), \qquad y' = -G'(x)$$

satisfies

$$\partial_{W_{\delta}}^{(n)}T(z) = \int_{0}^{T(z)} \frac{\partial_{W_{\delta}}^{(n)}m_{s}(\phi_{V_{\Psi}}(t,z))}{m_{s}(\phi_{V_{\Psi}}(t,z))}dt,$$

where the integration is performed along the cycle $\phi_{V_{\Psi}}(t, z)$ starting at z. (S. 2012)

In order to study convexity, one can consider μ_{s2} , which is the sum of a mixed term (both x and y) plus two pure terms (only x or only y):

$$\mu_{s2} = 4 \left[1 + 2 \frac{GG''}{G'^2} \cdot \frac{FF''}{F'^2} + \frac{3G^2G''^2 - 3GG'^2G'' - G^2G'G'''}{G'^4} + \frac{3F^2F''^2 - 3FF'^2F'' - F^2F'F'''}{F'^4} \right].$$

2nd order ODE's

<ロ> <@> < E> < E> E のQの

In the case of 2^{nd} order ODE's, i. e. if $F(y) = \frac{y^2}{2}$, μ_{s2} reduces to the following form

$$\mu_{s2} = \frac{G'^4 - 8G'^2GG'' + 12G^2G''^2 - 4G^2G'''G'}{G'^4}.$$

An alternative choice: use the normalizer

$$x' = rac{H_x}{H_x^2 + H_y^2} = rac{G'}{G'^2 + F'^2}, \qquad y' = rac{H_y}{H_x^2 + H_y^2} = rac{F'}{G'^2 + F'^2}.$$

An alternative choice: use the normalizer

$$x' = rac{H_x}{H_x^2 + H_y^2} = rac{G'}{G'^2 + F'^2}, \qquad y' = rac{H_y}{H_x^2 + H_y^2} = rac{F'}{G'^2 + F'^2}.$$

Its N-cofactor is

$$\mu_H = \frac{(F'' - G'')(G'^2 - F'^2)}{(G'^2 + F'^2)^2},$$

which does not separate variables, but does not require the non-degeneracy assumption .
